~~Continuous-Time Markov Decision Processes: Theory and ...~~

Continuous-time Markov decision processes (MDPs), also known as controlled Markov chains, are used for modeling decision-making problems that arise in operations research (for instance, inventory, manufacturing, and queueing systems), computer science, communications engineering, control of populations (such as fisheries and epidemics), and management science, among many other fields.

have been applied to a variety of decision problems in many contexts such as queueing systems, probabilistic model checking, security protocols, maintenance and epidemic management, to name just a few.

~~Optimal decisions for continuous time Markov decision ...~~

Based on system model, a Continuous-Time Markov Decision Process (CTMDP) problem is formulated. The CTMDP problem is then solved by using Bellman equation and relative value iteration.

chain, the family of matrices $P(t)$ (generally an infinite matrix) replaces the single transition matrix P of a Markov chain. In the case of Markov chains the matrix of transition probabilities after t units of time is given by P^t . The analogous statement for a continuous time Markov chain is $P(t)$

~~1 Continuous Time Processes~~ ~~Stanford University~~

Continuous in States and Actions and Time Steps Setting partial derivatives of V w.r.t. $a(t)$ to 0 gives optimal $a(t)$ $a(t)$ is now in terms of partial derivatives of V w.r.t. t and $s(t)$ Substituting $a(t)$ in V gives: $\frac{\partial V}{\partial t}(t; s(t); a(t)) = 0$ This is a partial differential equation for V in terms of t and s

~~Discrete versus Continuous Markov Decision Processes~~

The module first introduces the theory of Markov processes with continuous time parameter running on graphs. An example of a graph is the two-dimensional integer lattice and an example of a Markov process is a random walk on this lattice. Very interesting problems of such processes involve spatial disorder and dependencies (e.g. burning forests).

~~Sufficiency of Markov Policies for Continuous-Time Jump...~~

Markov chains and continuous-time Markov processes are useful in chemistry when physical systems closely approximate the Markov property. For example, imagine a large number n of molecules in solution in state A, each of which can undergo a chemical reaction to state B with a certain average rate. Perhaps the molecule is an enzyme, and the states refer to how it is folded.

~~WikiMili, The Best Wikipedia Reader~~

We consider the discounted continuous-time Markov decision process (CTMDP), where the negative part of each cost rate is bounded by a drift function, say w , whereas the positive part is allowed to be arbitrarily unbounded. Our focus is on the existence of a stationary optimal policy for the discounted CTMDP problems out of the more general class.
