Cyanide in Water and Soil | Taylor & Francis Group

Toxicological and analytical aspects of cyanide containing compounds are briefly touched. The behaviour of cyanide compounds in soil and groundwater is governed by many interacting chemical and microbial processes. Redox conditions and pH are of importance for the leaching and degradation of iron cyanide complexes.

1.1 This test method covers the determination of free cyanide in waste waters, ground waters, surface waters, drinking waters, soils and solid wastes. This test method reports the cyanide that dissociates from simple cyanides or weakly-bound metal cyanide complexes (Sec. 3.0) at room temperature, from a solution of pH 6-6.5 (Ref. 1).

How you could be exposed to cyanide You could be exposed to cyanide by breathing air, drinking water, eating food, or touching soil that contains cyanide. Cyanide enters water, soil, or air as a result of both natural processes and industrial activities. When present in air, it is usually in the form of gaseous hydrogen cyanide.

CDC | Facts About Cyanide

The half-life of cyanide in water is not known. Cyanide in water does not build up in the bodies of fish. Cyanides are fairly mobile in soil. Once in soils, cyanide can be removed through several processes. Some cyanide compounds in soil can form hydrogen cyanide and evaporate, whereas some cyanide compounds will be transformed into other chemical forms by microorganisms in soil.
