This book was conceived by Professor K.H. Ephraim, the former director of the Institute for Nuclear Medicine of the University Hospital of Utrecht. Unfortunately, due to a serious illness, he was not able to finish the work he started. He is, however, very pleased to know that the book is, nevertheless, being published. In principle the volume consists of two parts. The first is dedicated to basic science and technology in nuclear medicine. It provides the data which are necessary to a clear understanding of the possibilities and limitations of investigations which make use of radioactive materials. The second part of the book covers those disciplines in medicine in which nuclear medicine can be of help in solving certain clinical problems. Each chapter can be read separately, even without thorough knowledge of the first part of the book. The contributors to this book come from both Europe and North America. Each of them has written his chapter out of long-standing personal interest in his particular field of nuclear medicine. This book will be of value to a wide variety of professionals. It is of interest not only to clinicians of various specialties, but also to diagnostic professionals, i.e. radiologists and nuclear medicine clinicians. Last but not least it will be of use to physicians in training.

Designed to present students and professionals with a comprehensive update of recent developments not found in other textbooks on the subject, the various clinical applications of nuclear medicine techniques are considered here, and due attention is also given to radiopharmaceuticals, equipment and instrumentation, reconstruction techniques and the principles of gene imaging

This work is devoted to understanding the recent advances in nuclear medicine and molecular imaging technologies along with their application to integrated medical therapy and future drug development. This anthology is based on the international symposium in 2015 entitled "Perspective on Nuclear Medicine for Molecular Diagnosis and Integrated Therapy." The symposium provided an opportunity to exchange ideas on how to promote nuclear medicine technology and how to extend the technology to medical therapy and drug development, and was also a good opportunity to discuss the future perspective of nuclear medicine and molecular imaging by worldwide leaders in the field. Molecular imaging technologies have been rapidly developed worldwide in recent years. Among those developments, nuclear medicine has come to play an important role in quantitative analysis of biological process in vivo as well as in wide clinical use. With the current progress of nuclear medicine and molecular imaging, this modality has been applied for treatment monitoring and predicting its outcome with the use of optimal imaging biomarkers and suitable quantitative analysis. Truly, a new era has arrived with clinical use of nuclear medicine and molecular imaging for personalized medicine. This volume will benefit a wide variety of researchers in life science including those working in drug development, molecular imaging, and medical therapy as well as physicians who utilize diagnostic imaging.
