Fastener Edge Distance and Spacing Common design practice is to use a nominal edge distance- $f$   $2D$  from the fastener hole centerline, where  $D$  is the fastener diameter. The minimum edge distance should not be less than  $1.5D$ . The nominal distance between fasteners is  $4D$ , but the thickness of the materials being joined can be a significant factor. For thin materials, buckling

A practical starting point for all threaded fastener tightening analysis is to use the basic elastic torque-tension equation,  $T = K \cdot D \cdot F$ , to estimate the relative magnitudes of torque and clamp force. Starting with this equation, which defines a linear relationship between torque and tension, you can develop models for the tightening process.
