Roots of the theory and practice of ocular pharmacology may be traced to the ancient Mesopotamian code of Hammurabi and then to several papyri reflecting the clinical interests of the Egyptians. The evolution of its art and science was irregularly paced until the nineteenth century when Kohler, in 1884, proved the anesthetic effect of cocaine on the cornea, and when Fraser, Laquer, Schmiedeberg, Meyer, and others studied the pharmacology of the autonomic nervous system by way of observations of the pupil. Advances in the past few decades have been nothing short of explosive. How can the student, physician, or basic research scientist stay in touch with these electrifying studies? To help with the answer to this question, the authors set as their goal the development of increased understanding so that the student, research scientist, and ophthalmologist can cope with the latest discoveries. The authors want to narrow what appears to be an ever-increasing gap between basic science and ophthalmology. The basic aspects of pharmacology have been presented in light of the natural physiology. In this regard, while distinctions among endogenous mechanisms, drug effects, and the pathogenesis of disease are to be separately recognized, appreciation must be given to the concept that both the desirable and unwanted

manifestations or functions caused by either disease or drugs must very often represent a quantitative change in normal metabolic pathways.

This volume of the Handbook of Experimental Pharmacology (Concepts in Biochemical Pharmacology) will show that pharmacology has finally arrived as a true discipline in its own right, and is no longer the handmaiden of organic chemistry and physiology. Instead it is an amalgam of all the biological sciences including biochemistry, biophysical chemistry, physiology, pathology and clinical medicine. In the volumes that make up Concepts in Biochemical Pharmacology we hope to convince Medical Schools what should now be obvious, that pharmacology is no longer that dull topic bridging the basic sciences with medicine, but is probably the most important subject in the medical curriculum. We are grateful for the advice of Dr. Byron Clark, Director of the Pharmacology-Toxicology Program at the National Institutes of Health whose support made possible much of the work described in this volume.

The Molecular Biology of Cancer discusses the state of progress in the molecular biology of cancer. The book describes the effects of anticancer agents on nucleolar ultrastructure; the role of chromosomes in the causation and progression of cancer and leukemia; the replication, modification, and repair of DNA. The text also describes the metabolism and utilization of messenger RNA and other high molecular weight RNA and low molecular weight nuclear RNA; the characteristics, structures, and functions of nuclear proteins; and the process of protein synthesis. Nucleotides are reviewed with regard to its biosynthesis, inhibition of synthesis, and development of resistance to inhibitors. The book further tackles the biochemical mechanisms of chemical carcinogenesis; the oncogenic viruses; and the molecular correlation concept. The text also demonstrates phenotypic variability as a manifestation of translational control; and plasmacytomas. Molecular biologists, virologists, pathologists, cell biologists, oncologists, pharmacologists, and students taking related courses will find the book useful.
