What is friction? - BBC Bitesize

The amount of friction of a surface can be looked at as the amount by which it resists something moving over it, or how 'grippy' it is. The more resistance, the grippier a surface and the higher the friction. The less resistance to movement, or more slippery a surface is, then the lower the friction of the surface.

What is friction?

When two surfaces slide against each other, a force called friction makes them stick very slightly together. Smooth surfaces, like ice and glass, are easy to slide over. They create very little friction. Rough surfaces like rock and sand create much more friction, and are easy to grip on to.

We'll explore the most basic model, dry friction, which is where engineers often start. And we'll look at two applications, tipping and sliding, and rope around the bollard. We could present many more, friction clutches, drum brakes, friction vibration dampers, bearings, screw threads.

Modelling friction

friction noun [U] (FORCE) physics. the force that works against an object as it slides along the surface of another object or moves through a liquid or gas: A gasoline engine loses over 70 percent of its energy to friction and heat.

Friction is a force that is created when two surfaces move or try to move across each other. The amount of friction produced during this process depends on the texture of both the surfaces and the amount of contact force pushing the two surfaces together. Friction always opposes the motion or attempted motion of one surface across another surface.
