Projectile motion can be modeled by a quadratic function. Projectile motion involves objects that are dropped, thrown straight up, or thrown straight down. Factors that influenc the height of these object include the height from which the objects are dropped or thrown, whether upward/downward velocity is involved, and of course, the pull of gravity downward on the object.

Mathbits Answers Projectile Motion A model rocket is launched vertically upward from ground level with an initial velocity of 39.2 meters per second. Its height, h, after t seconds, is modeled by the equation $h = -4.9t^2 + 39.2t$.How long, in seconds, will it be before the rocket hits the ground?
