vapour pressure of the solutes increases and the chromatographic process begins. With this injection technique no evaporation in a heated space takes place.

On-Column Injection in Capillary Gas Chromatography (COC)

On-Column Injection On-column injection is the preferred technique when the liquids present in the sample have widely differing boiling points. The liquid sample is introduced directly into the inlet of a wide bore (0.53 mm) capillary column.

Cold on-column injection - Chemistry LibreTexts

The On-Column Injector. A mode of injection that avoids the hot injection liner all together is useful for thermally unstable (labile) or for GC samples with large, analyte-boiling-point differences that suffer discrimination in flash vaporization. This is the cold on-column injector. Here's one design: In this specialized set-up (easily available via retrofitting common split/splitless injectors) a tall, low-thermal-mass extension is attached to the top of the injector.

Split/Splitless and On-Column Gas Chromatographic Injectors

This is especially true for on-column injection ports that are only heated by the GC oven (and not heated independently). While we are on the topic of on-column water injections, if you must do them, we strongly recommend using a Polar-deactivated guard column, even if using fully bonded stationary phases. This guard column (retention gap) will improve wettability when using non-polar stationary phases, and it will help keep non-volatile residue out of all columns, no matter the phase.

A guard column/retention gap is a short (1-5 m) piece of uncoated deactivated fused silica tubing which is placed in-line between the GC injection port and the capillary column. The guard column/retention gap is used to take the brunt of the contamination/damage from the solvent and sample.

How to Choose a Capillary GC Column | Sigma-Aldrich

An optimized chromatographic separation begins with the column. The selection of the proper capillary column for any application should be based on four significant factors: stationary phase, column I.D., film thickness, and column length.

The main difference between packed column and capillary column is that, in a packed column, the stationary phase is packed into the cavity of the column whereas, in a capillary column, the stationary phase coats the inner surface of the cavity of the column. Furthermore, we mainly use packed columns in liquid-liquid extractions and capillary columns in gas chromatography.

Using high pressure, the pressure injection cell has proved invaluable for two applications: densely packing nanobore capillary columns with solid-phase particles; and precisely infusing microliter samples directly from microcentrifuge tubes into mass spectrometers without additional transfers, wasted sample, or contact with metallic surfaces which adsorb some negatively charged molecules such as peptides with phospho or carboxy groups.

Direct Injector for Packed Columns Direct injection is not suitable for other capillary columns due to their small sample capacity, at least not as long as the sample is a liquid introduced by means of a syringe. In combination with a gas valve (analysis of gases) it is possible to apply direct injection to capillary columns.

Split or Splitless Injection in Capillary Gas Chromatography
LC/MS is best done with capillary HPLC. Capillary HPLC uses smaller column internal diameters than conventional HPLC. Smaller ID columns, for fixed amounts of injected material, produce taller peaks. Taller peaks provide better detection limits for mass spectrometry and other concentration sensitive detectors.

On-column injection into a hot gas chromatograph oven involves the danger that the bottom part of the needle is warmed up above the boiling point of the solvent in the sample. Consequently parts of the sample are evaporated out of the needle instead of being introduced as a liquid into the capillary column.

The handbook also includes many practical guidelines. From reviews of former editions: "This substantial book is on injection techniques alone, which ... demonstrates this can have many pitfalls ... no one should be allowed to direct a laboratory doing quantitative analysis by GC without first being thoroughly familiar with this book ..." The Analyst "This is a detailed reference volume filled with practical suggestions and techniques for managing split and splitless injection in the day-to-day world of the working gas chromatographer.
