PSSM in horses or Polysaccharide storage myopathy is a severe and inheritable glycogen storage disease characterized by muscle damage, stiffness, reluctance to move, and severe colic. The primary cause of the disease is overfeeding of readily digestible carbohydrates by the horse and genetic factors. Few horse breeds are more susceptible to PSSM than other breeds.

[PSSM in Horses: Types, Symptoms, Diagnosis, and Management](#)

The diagnosis of colic mainly depends on the close monitoring of the history of horses (Like feeding, bedding, care, and managerial factors). Your vet will decide the treatment procedure for your horse colic. The prevention of colic is more important than treatment because the preventive measure can save the life of your horse.

Poor performance; Changes in behaviour and attitude - this may be either an increase in fear and flightiness or dull and quiet. Abdominal discomfort - the tightening of the girth may show signs of discomfort. Some horses may stretch more and urinate more often. Diagnosis

[Gastric Ulcers In Horses](#)

Wobblers may be caused by compression or malformation of the spine in the neck that makes the animal stiff and uncoordinated. The horse may be born with a predisposition or there may be a nutritional connection or injury. This is why it is so important to patiently teach a youngster to stand quietly while tied and to tie adult horses safely. A fall in the pasture while playing, or while being ridden may damage the vertebrae in the neck.

[Intro to Wobblers Syndrome in Horses](#)

Kissing spines is a major cause of poor performance and gait abnormality but is often not detected by the rider until it is significantly affecting performance. It is thought that this problem is related to certain types of use of the horse, and in particular its back, hence why it is frequently seen in horses jumping at speed such as eventers, hurdlers and chasers.
