Radiowave Propagation In Satellite Communications  
Satellite systems rely on the transmission of radiowaves to and from the satellite and are dependent on the propagation characteristics of the transmission path, primarily the earth's atmosphere. Radiowave propagation thus plays a very important part in the design and ultimate performance of space communications systems.

Abstract. The first space craft was launched in the 1960s and placed successfully in an orbit around the Earth. Further achievements in the space telecommunications technologies led scientists and radio experts to employ space facilities for expansion of the telecommunications services to meet ever-increasing requirements of the world community.

Propagation for satellite communications. Most communications satellites are placed in geo-stationary orbits 36000km above the equator, therefore transmitting and receiving earth stations can fix their antenna positions with only minor adjustments being required for small shifts in satellite position or changes in atmospheric propagation conditions.

Radiowave Propagation in Satellite Communications

Radio propagation is the behavior of radio waves as they travel, or are propagated, from one point to another, or into various parts of the atmosphere. As a form of electromagnetic radiation, like light waves, radio waves are affected by the phenomena of reflection, refraction, diffraction, absorption, polarization, and scattering. Understanding the effects of varying conditions on radio ...

Radio Wave Propagation in Satellite Communication Systems ...

Before any communications satellite is launched, the radio frequencies to be used for transmitting and receiving signals must be agreed and coordinated through the ITU. The nature of the traffic to be passed through the satellite must also be fully characterized and assessed so it is compatible with the frequency spectrum made available and the onboard radio frequency (RF) payload designed accordingly.

This form of propagation can enable radio amateurs to communicate globally at frequencies of 140 MHz and above, effectively using the Moon as a giant reflector satellite. In addition to these categories, many short range wireless or radio communications systems have RF propagation scenarios that do not fit neatly into these categories.
