This color atlas is a practical pictorial guide to the diagnosis of skin and nail conditions of the lower extremities. It features more than 1,000 detail-revealing full-color clinical photographs of over 100 common and uncommon lesions, grouped into easy-to-follow categories. The succinct text accompanying each photograph explains the lesion's salient features and, whenever possible, provides a differential diagnosis. Therapeutic recommendations offered include new treatments for fungal nails and for scars. The opening chapter, on general principles, includes a classification with an algorithm and a problem-oriented algorithm. Subsequent chapters cover the entire gamut of disease entities--eczema; contact dermatitis; drug and toxic reactions; papulosquamous diseases; benign tumors; premalignant and malignant tumors; bacterial, viral, and fungal skin infections; infestations, parasites, and bites; developmental disorders; manifestations of internal disease; manifestations of circulatory disease; sweat and associated disorders; mechanical injuries; psychocutaneous disorders; nail disorders; and scar conditions.

Like its predecessors, Text Atlas of Nail Disorders, third edition is destined to become an invaluable diagnostic tool. The authors comprehensively cover pathologies affecting the toe and finger nails. They profile each pathology, from common to rare disorders, and support them with extensive color photographs. This latest edition contains new material on podiatry and investigation techniques including histopathology, ultrasonography and MRI, and dermatoscopy making this an invaluable diagnosis aid for dermatologists and podiatrists.

Merriman's Assessment of the Lower Limb has established itself through two editions as the benchmark text book of lower limb examination and assessment. The third edition preserves the lucidity, logical approach and comprehensive coverage of its predecessors but adds many exciting features, including online resources (videos and images), many new contributors, thorough updating of all chapters – many of which have been completely rewritten – and an entirely new chapter on functional assessment. The online resources (access via <http://booksite.elsevier.com/9780080451077>) provide extensive videos of assessment techniques and illustrations: practitioners with patients and models show how to assess all parts of the lower limb, and evaluate various conditions. Together with its companion volume Clinical Skills in Treating the Foot, the new third edition of Merriman's Assessment of the Lower Limb is a truly indispensable guide for podiatry students and practitioners, as well as trainee general practitioners, medical students working in rheumatology, diabetology and orthopaedics,

sports therapists and sports medicine trainees. Online resources incorporating videos and illustrations: invaluable footage of assessment techniques downloadable full colour figures and extra radiological photographs Log on to <http://booksite.elsevier.com/9780080451077> and follow the on-screen instructions. Many new contributors bringing fresh expertise and insights for today's student All chapters thoroughly rewritten and updated New chapter on functional assessment Case histories help put learning in context

A comprehensive textbook of dermatological conditions involving the lower extremities. Provides a detailed description of each condition, accompanied by vivid color photographs. Diagnostic tests and treatment recommendations are also included, as are comprehensive references. Differentiates between localized skin lesions and cutaneous manifestations of systemic disorders, provides an overview of dermatology of the lower extremity, examines the histopathologic processes that can cause skin problems, reviews the principles of diagnosis and the classification of lesions, describes the different types of lesions, offers a flow sheet to facilitate diagnosis, details the clinical presentation of the full range of lower extremity skin disorders, and presents special considerations for diagnosis and treatment. Contains more than 700 remarkable close-up photographs (695 in full color) that vividly depict the many types of skin diseases that can affect the lower extremities. Features a logical organization in which similar disorders are grouped together, making it easy to locate a general family of problems and then determine which specific condition is affecting a particular patient. Outlines the diagnostic tests and treatments that are most effective for each condition. Includes many helpful references in every chapter.

An era of global population aging is upon us. By 2030, one in eight people will be over age 65. Since women generally live longer than men, the health and welfare of postmenopausal women will become a significant public health concern. This book offers a comprehensive review of the life changes associated with menopause, both at the dermatological and physiological level (e.g., hormonal, immunological) and at the subcellular level. It critically examines the dermatological, biological, and clinical challenges to postmenopausal health and well-being and the current and emerging therapeutic interventions. The authors advocate a holistic approach, emphasizing the need to view the menopause as a life transition with various facets rather than as a series of distinct medical conditions to be managed. Our goal is to offer a comprehensive resource to the researchers, clinicians, physicians, and helping professions whose mission is to promote the health and well-being of women around the world.

Over the last decade, it is becoming increasingly clear that diabetes mellitus is a global epidemic. The influence of diabetes is most readily apparent in its manifestation in foot complications across cultures and continents. In this unique collaboration of global specialists, we examine the explosion of foot disease in locations that must quickly grapple with both mobilizing medical expertise and shaping public policy to best prevent and treat these serious complications. In other areas of the world where diabetic foot complications have unfortunately been all too common, diagnostic testing and advanced treatments have been developed in response. The bulk of this book is devoted to examining the newest developments in basic and clinical research on the diabetic foot. It is hoped that as our understanding of the pathophysiological process expands, the devastating impact of diabetic foot complications can be minimized on a global scale.
