The anion is named by taking the elemental name, removing the ending, and adding "ide." For example, F-1 is called fluoride, for the elemental name, fluorine. The "ine" was removed and replaced with "ide." To name a compound, the cation name and the anion named are added together. For example, NaF is also known as sodium fluoride.

Their name is always written as 2 element names, plus the -ide suffix attached to the second name. Examples of simple binary ionic compounds include potassium oxide and sodium phosphide. If the "-ide" suffix doesn't follow a single element name, see instructions for polyatomic ions. For example, "oxide" is a simple oxygen ion, but "hydroxide" and "peroxide" are polyatomic.

Emphasises on contemporary applications and an intuitive problem-solving approach that helps students discover the exciting potential of chemical science. This book incorporates fresh applications from the three major areas of modern research: materials, environmental chemistry, and biological science.
